Dear Zarego Hiring Team,

I am applying for the Full Stack Software Engineer - US Remote role because the work described is close to the kind of engineering I have been doing most recently: building practical web applications, connecting frontend workflows to backend APIs, and adding AI features where they make the product more useful. I am especially interested in the mix of React, Next.js, Node.js, AI-powered application logic, and startup-style problem solving.

At SmartSolve, I have been building secure internal software with Next.js, TypeScript, PostgreSQL, Drizzle ORM, SSO, auth middleware, Docker, Git, and AI-assisted development workflows. One current project is an onboarding tracker that centralizes new-hire workflows and protects sensitive employee data. Another is an AI-enabled QMS dependency register, where the first challenge was not just coding a feature but turning unclear document relationships into a structure that could be reviewed and implemented.

My project work maps directly to the AI implementation side of the role. I built Fix-It-Flow as a Next.js 14/TypeScript PWA with typed API routes, camera input, voice commands, Gemini Vision, LLM reasoning, ElevenLabs text-to-speech, and DynamoDB-backed session persistence. I also built RocketGrader, a full-stack AI feedback platform with Express REST APIs, MongoDB/Mongoose models, Auth0, AWS S3 file workflows, and LangChain/Mistral AI grading logic. Those projects taught me that useful LLM features depend on the normal engineering around them being clear: data models, API boundaries, auth, error handling, and user workflows.

I would bring Zarego a practical full-stack style: build the web experience, own the backend logic, keep AI features grounded in the workflow, and stay careful about maintainability as requirements change.

Best regards,
Aryan Miriyala
