Dear WelbeHealth Hiring Team,

I am applying for the AI Engineer I role because the work is practical in a way that matters to me. WelbeHealth is trying to use AI inside PACE care and operations, where answers need to be grounded, secure, and useful for real teams supporting vulnerable seniors. That is the kind of AI engineering I want to grow in, not a demo that stops at a model call.

My strongest match is building AI systems around source material, workflows, and reviewable outputs. I built FalconGraph Search, a RAG system that crawled campus webpages and documents, cleaned and chunked the content, generated embeddings, retrieved evidence with FAISS, and returned cited answers through a FastAPI and Next.js interface. I also built a health AI prototype that used an Express and MongoDB disease API, country-risk retrieval, health-profile context, and a Mistral chatbot to answer travel-health questions and generate vaccination checklist PDFs. Those projects taught me to think about retrieval quality, chunking, context, structured output, and what the user needs to trust before acting on an AI response.

I also bring production-minded software and data experience from my internships. At SmartSolve, I use Codex and Claude Code for planning, debugging, implementation, and review while validating generated code myself, and I built secure internal software with Next.js, TypeScript, PostgreSQL, Drizzle ORM, SSO, auth middleware, Docker, and Git. At AAIS, I automated Python, PySpark, AWS Glue, S3, IAM, and Lambda workflows over large insurance datasets, including PII tokenization and validation. At the Alliance for Paired Kidney Donation, I worked on an AWS-hosted healthcare workflow platform where audit logging, access control, form reliability, and data-entry safeguards mattered for internal clinical operations.

I would bring WelbeHealth a careful early-career engineering style. I can contribute code, ask good questions, document what I learn, and keep AI outputs grounded in the data and workflow they are supposed to support.

Best regards,  
Aryan Miriyala
