Dear Sony Interactive Entertainment Hiring Team,

I am applying for the Software Engineer I role on the Unified Telemetry team because the work sits at a strong intersection for me: building responsive product surfaces, backend services, and data-driven systems where reliability and user experience both matter. Sony Interactive Entertainment's PlayStation platform reaches more than 100 million people, and the idea of contributing to telemetry tooling that helps teams understand and improve those experiences is the part of the role that stands out most.

My recent work has prepared me for that kind of full-stack and data-platform collaboration. At Smart-Solve, I architected a Next.js and TypeScript onboarding tracker with PostgreSQL, Drizzle ORM, SSO, and authentication middleware for sensitive employee workflows, then built Docker-based development environments to make setup and review more reproducible. At AAIS, I worked closer to the data-platform side: I automated a manual SQL billing workflow with Python, PySpark, and AWS Glue over 20+ TB of production insurance data, built S3-based validation workflows, and contributed to React/Node.js RBAC and JWT modernization for about 110 internal users.

I have also built projects that map directly to SIE's frontend, backend, mobile, and telemetry needs. Fix-It-Flow uses typed Next.js API routes, DynamoDB session persistence, camera input, voice commands, and AI services to manage a stateful user workflow. Travel Health Advisor pairs a React interface with Express and MongoDB APIs for disease-risk data, and my C++/OpenMP research system records per-epoch telemetry to evaluate runtime scheduling decisions. Those projects gave me practice translating technical requirements into usable interfaces, maintaining clear system boundaries, and documenting enough design context for other engineers to review the work.

I would welcome the chance to bring that same practical engineering approach to Sony Interactive Entertainment: careful TypeScript/JavaScript implementation, secure full-stack architecture, and data-aware judgment for systems that support PlayStation-scale product decisions.

Best regards,
Aryan Miriyala
