Dear College Board Hiring Team,

I am applying for the Full Stack Engineer role because the Core Assessment Platform work combines two areas I care about: reliable software systems and education. The posting stood out to me because it is not only asking for feature work. It is asking for shared platform capabilities that have to be accurate, secure, reusable, and trusted by people working in high-stakes assessment environments.

My background lines up most closely with the full-stack, cloud, and security parts of the role. At SmartSolve, I built a Next.js and TypeScript onboarding tracker with PostgreSQL, Drizzle ORM, SSO, and auth middleware for internal workflows involving sensitive employee data. At AAIS, I worked on production AWS data workflows, including Python/PySpark jobs over 20+ TB of insurance data, AWS Glue Workflows, S3 pipelines, IAM access controls, and AWS Lambda validation that tokenized PII before downstream processing. Those experiences taught me to break unclear requirements into implementable pieces while still paying attention to access controls, data quality, and maintainability.

I also have direct education-product context from projects and university work. RocketGrades was a full-stack AI assignment feedback platform with Angular, TypeScript, Express, MongoDB, Auth0, AWS S3, file parsing, and structured feedback workflows for teachers and students. As a graduate research assistant at BGSU, I created cybersecurity learning materials and led 10 undergraduate students in organizing a middle-school CyberCamp. That work helped me learn how much clarity matters when software or technical material is supporting real learners.

I know this role asks for strong production ownership and mature engineering judgment. I would bring practical experience across React/Node systems, AWS workflows, secure internal tooling, AI-assisted development with human review, and clear technical communication. I would be excited to contribute to College Board's platform work while continuing to grow around architecture, delivery standards, and systems that affect students at real scale.

Best regards,
Aryan Miriyala
