Dear Sony Interactive Entertainment Hiring Team,

I have been a PlayStation person since third grade. The first game I ever played was God of War II, and I still remember how different it felt from anything else I had seen at that age. Now I am waiting for GTA 6 on PS5 like a lot of other people, so applying to Sony Interactive Entertainment feels a little different from a normal application. PlayStation is something I grew up with, and I would be proud to work on software that helps make those player experiences smoother, safer, and easier for teams to understand.

I also like that the work is practical software engineering, not just writing code in isolation. At Smart-Solve, I built a Next.js and TypeScript onboarding tracker with PostgreSQL, Drizzle ORM, SSO, and authentication middleware for sensitive employee workflows, then set up Docker-based development environments so the team could run and review the app more consistently. At AAIS, I automated a manual SQL billing workflow with Python, PySpark, and AWS Glue over 20+ TB of production insurance data, built S3-based validation workflows, and contributed to React/Node.js RBAC and JWT modernization for about 110 internal users. My projects have pushed me in the same direction, from typed Next.js API routes with DynamoDB persistence to C++/OpenMP runtime telemetry research. I know I am still early in my career, but I care about building useful software that is clear, secure, and grounded in real user behavior. That is the kind of work I would want to bring to PlayStation.

Best regards,
Aryan Miriyala
