Dear Supabase Hiring Team,

I am applying for the Security Operations Engineer role because it matches the part of security work I have kept coming back to: taking messy technical signals, figuring out what matters, and turning the result into something other people can act on. Supabase's product security team needs someone who can handle alerts and sensitive access requests carefully, write clearly, improve runbooks, and escalate with good judgment. That is the kind of entry-level security role where my mix of cybersecurity education, secure workflow engineering, SQL, AWS, and support experience fits best.

At BGSU, I developed cybersecurity labs and training material across phishing, password security, email authentication, email forensics, cryptography, secure key management, OWASP tooling, packet analysis, and ethical-hacking workflows, then led 10 undergraduates in organizing a middle-school CyberCamp. That work forced me to explain security issues plainly, build repeatable exercises, and keep the audience's skill level in mind. In my engineering internships, I worked on the systems side of the same themes: SSO and authentication middleware in a Next.js/PostgreSQL onboarding tracker at SmartSolve, RBAC and JWT patterns for about 110 AAIS internal users, PII tokenization through AWS Lambda/S3 workflows, and anti-CSRF plus IP-aware audit logging in a healthcare workflow platform.

I know this role is not about claiming to be a senior security engineer. What I can bring is a strong foundation, calm attention to detail, and a habit of writing down the decision path so the next person can follow it. I would be excited to help Supabase protect developer accounts and internal workflows while learning from a product security team operating at real scale.

Best regards,
Aryan Miriyala
