HiringCafe Team

Dear HiringCafe Team,

I am applying for the Founding Full-stack / Product Engineer role because the problem feels very real to me. I have spent a lot of time building and using my own career-operations repo because job discovery is noisy, inconsistent, and often full of stale or badly structured information. HiringCafe's focus on making job search fast, honest, comprehensive, and useful is the kind of product problem I would want to work on every day, especially because the engineering decisions directly affect people trying to find real opportunities.

My closest match is a project I built around the same problem space. Career Ops separates broad job discovery from agent-assisted application-package generation, pulls structured postings from Greenhouse, Lever, Ashby, and SmartRecruiters, filters early-career roles, writes CSV and Markdown review outputs, and validates tailored LaTeX application packages with page-count, text-extraction, alignment, and artifact checks. It is not HiringCafe-scale, but it gave me hands-on experience with the messy parts of job data: provider differences, noisy metadata, missing dates, source tracking, filtering, and keeping human approval in the loop.

I also bring product and full-stack experience from building a Next.js/PostgreSQL onboarding tracker with SSO/auth middleware at SmartSolve, React/Node.js access-control modernization at AAIS, and Fix-It-Flow, a Next.js/TypeScript AI repair PWA with typed API routes, camera input, voice commands, Gemini Vision, and DynamoDB-backed session state. Across those projects, I have had to move between UI, backend routes, data models, auth, validation, and practical product tradeoffs. I have not worked with Firebase, Elasticsearch, Redis, or Stripe in production yet, but I am comfortable going deep on unfamiliar systems and being honest about what I know while getting up to speed quickly.

What stands out about HiringCafe is the combination of product urgency and real user impact. A founding engineering role is a stretch in responsibility, but it is the kind of environment where I would want to be close to users, ship carefully, and own work end to end instead of only touching a narrow slice of the stack.

Sincerely,
Aryan Miriyala
